1. Problem Statement

Mary is managing a business and wants to analyze its profitability. She operates both a regular business model and a seasonal business model. To assess profitability, she uses a program that calculates and compares the profit margins for both models based on revenue and cost.

The program defines:

BusinessUtility class with a method calculateMargin(double revenue, double cost).SeasonalBusinessUtility (inherits from BusinessUtility) and overrides calculateMargin(double revenue, double cost), adding a seasonal adjustment of 10% to the base margin.ProfitabilityChecker class with a method checkProfitability(double regularMargin), which prints "Business is profitable." if the regular margin is 10% or more, otherwise prints "Business is not profitable.".

Mary inputs revenue and cost, and the program compute and display the regular and seasonal margins using:

Margin = ((Revenue − Cost) / Revenue) × 100

Seasonal Margin = Margin + 10

Input Format

The first line of input consists of a double value r, representing the revenue.

The second line consists of a double value c, representing the cost.

Output Format

The first line prints a double value, representing the regular profit margin, rounded to two decimal places, in the format: "Regular Margin: X. XX%", where X.XX denotes the calculated regular margin.

The second line prints a double value, representing the seasonal profit margin, rounded to two decimal places, in the format: "Seasonal Margin: X. XX%", where X.XX denotes the calculated seasonal margin.

The third line prints a string, indicating whether the business is profitable or not profitable, based on the regular margin.

If the regular margin is less than 10, print "Business is not profitable.". If it is 10 or greater, print "Business is profitable."

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 1000.0
800.0

Output: Regular Margin: 20.00%
Seasonal Margin: 30.00%
Business is profitable.

Answer

```
import java.util.Scanner;
```

```
class BusinessUtility {
    public double calculateMargin(double revenue, double cost) {
        return ((revenue - cost) / revenue) * 100;
    }
}

class SeasonalBusinessUtility extends BusinessUtility {
    @Override
    public double calculateMargin(double revenue, double cost) {
        double baseMargin = super.calculateMargin(revenue, cost);
        return baseMargin + 10;
    }
}

class ProfitabilityChecker {
    public void checkProfitability(double regularMargin) {
        if (regularMargin >= 10) {
            System.out.println("Business is profitable.");
        } else {
            System.out.println("Business is not profitable.");
        }
    }
}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        double revenue = scanner.nextDouble();
        double cost = scanner.nextDouble();
        BusinessUtility business = new BusinessUtility();
        SeasonalBusinessUtility seasonalBusiness = new
SeasonalBusinessUtility();
        double regularMargin = business.calculateMargin(revenue, cost);
        double seasonalMargin = seasonalBusiness.calculateMargin(revenue,
cost);

        System.out.printf("Regular Margin: %.2f%%\n", regularMargin);
        System.out.printf("Seasonal Margin: %.2f%%\n", seasonalMargin);

        ProfitabilityChecker checker = new ProfitabilityChecker();
        checker.checkProfitability(regularMargin);
        scanner.close();
    }
```

}

Status : Correct ***Marks : 10/10***

2. Problem Statement

A painter needs to determine the cost to paint different shapes based on their surface area. The program should be designed to handle the area of a sphere and calculate the total painting cost using the following formulas:

Area of sphere: Area = 4 * pi * r² where pi = 3.14Total painting cost: Cost = cost per square meter * area of sphere

The program will consist of three classes:

Shape class: This class should set the shape type and radius.Area class: This class should extend Shape to calculate the area.Cost class: This class should extend Area to calculate the total painting cost.

Input Format

The input consists of a string representing the shape type, a double value representing the radius, and another double value representing the cost per square meter on each line.

Output Format

For a valid shape type of "Sphere":

- The first line prints: "Area of Sphere is: <calculated_area>" rounded to two decimal places.
- The second line prints: "Cost to paint the shape is: <total_painting_cost>" rounded to two decimal places.

For any other shape types, print: "Invalid type".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: Sphere

3.4
5.8
Output: Area of Sphere is: 145.19
Cost to paint the shape is: 842.12

Answer

```
import java.util.Scanner;

class Shape {
    protected String shapeType;
    protected double radius;

    public void setShape(String shapeType, Scanner scanner) {
        this.shapeType = shapeType;
        if ("Sphere".equals(shapeType)) {
            this.radius = scanner.nextDouble();
        }
    }
}

class Area extends Shape {
    protected double area;

    public void calculateArea() {
        if ("Sphere".equals(shapeType)) {
            area = 4 * 3.14 * radius * radius;
            System.out.printf("Area of Sphere is: %.2f%n", area);
        } else {
            System.out.println("Invalid type");
        }
    }
}

class Cost extends Area {
    private double costPerSqMeter;
    private double totalCost;

    public void setCost(double costPerSqMeter) {
        this.costPerSqMeter = costPerSqMeter;
    }

    public void calculateCost() {
```

```
        if ("Sphere".equals(shapeType)) {
            totalCost = costPerSqMeter * area;
            System.out.printf("Cost to paint the shape is: %.2f%n", totalCost);
        }
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String s = scanner.next();
        Cost shape = new Cost();
        shape.setShape(s, scanner);
        double costToPaint = scanner.nextDouble();
        shape.calculateArea();
        shape.setCost(costToPaint);
        shape.calculateCost();
    }
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Arun wants to calculate the age gap between the grandfather and the son and determine the father's age after 5 years.

Your task is to assist him in developing a program using three classes: GrandFather, Father, and Son, where the GrandFather stores the grandfather's age, the Father extends GrandFather to include the father's age and calculates his age after 5 years, and Son extends Father to include the son's age and calculate the age difference between the grandfather and the son.

Input Format

The input consists of three integers representing the ages of the grandfather, father, and son, one per line.

Output Format

The first line of output prints "Grandfather and son's age gap:" followed by an

integer representing the age gap between the grandfather and the son, ending with "years".

The second line prints "Father's Age:" followed by an integer representing the father's age after 5 years, ending with "years".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 50
30
3
Output: Grandfather and son's age gap: 47 years
Father's Age: 35 years

Answer

```
import java.util.Scanner;

class GrandFather {
    protected int grandfatherAge;

    public void setGrandfatherAge(int age) {
        this.grandfatherAge = age;
    }
}

class Father extends GrandFather {
    protected int fatherAge;

    public void setFatherAge(int age) {
        this.fatherAge = age;
    }

    public int calculateFatherAgeAfter5Years() {
        return fatherAge + 5;
    }
}

class Son extends Father {
```

```
    private int sonAge;

    public void setSonAge(int sonAge) {
        this.sonAge = sonAge;
    }

    public int calculateGrandfatherSonAgeDifference() {
        return grandfatherAge - sonAge;
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        Son son = new Son();

        int grandfatherAge = scanner.nextInt();
        son.setGrandfatherAge(grandfatherAge);

        int fatherAge = scanner.nextInt();
        son.setFatherAge(fatherAge);

        int sonAge = scanner.nextInt();
        son.setSonAge(sonAge);

        System.out.println("Grandfather and son's age gap: "+
son.calculateGrandfatherSonAgeDifference() + " years");

        int fatherAgeAfter5Years = son.calculateFatherAgeAfter5Years();
        System.out.println("Father's Age: " + fatherAgeAfter5Years + " years");
    }
}
```

Status : Correct **Marks : 10/10**

4. Problem Statement

A bank provides two types of deposit schemes: Fixed Deposits (FD) and Recurring Deposits (RD). Customers want to calculate the interest they can earn based on their selected scheme.

Develop a Java program using inheritance to compute the interest for FD and RD. The program should include:

A base class Account with attributes accountHolder and principalAmount, along with a method for interest calculation.A subclass FixedDeposit that calculates interest for FD.A subclass RecurringDeposit that calculates interest for RD.

Formulas Used:

Interest for FD: (principal amount * duration in years * rate of interest) / 100

Interest for RD: (maturity amount * duration in months * rate of interest) / (12 * 100), where maturity amount = monthly deposit * duration in months.

Input Format

The first line of input consists of the choice (1 for FD, 2 for RD).

If the choice is 1, the following lines consist of account holder (string), principal amount (double), duration in years (int), and rate of interest (double).

If the choice is 2, the following lines consist of account holder (string), monthly deposit (int), duration in months (int), and rate of interest (double).

Output Format

The output prints the calculated interest with one decimal place in the following format.

For choice 1: "Interest for FD: <calculated interest >"

For choice 2: "Interest for FD: <calculated interest >"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1
Alice
50000.56
5

6.5

Output: Interest for FD: 16250.2

Answer

```
import java.util.Scanner;

class Account {
    protected String accountHolder;
    protected double principalAmount;

    public void setAccountHolder(String accountHolder) {
        this.accountHolder = accountHolder;
    }

    public void setPrincipalAmount(double principalAmount) {
        this.principalAmount = principalAmount;
    }

    public double calculateInterest() {
        return 0.0;
    }
}

class FixedDeposit extends Account {
    private int durationInYears;
    private double rateOfInterest;

    public FixedDeposit(String accountHolder, double principalAmount, int
durationInYears, double rateOfInterest) {
        this.accountHolder = accountHolder;
        this.principalAmount = principalAmount;
        this.durationInYears = durationInYears;
        this.rateOfInterest = rateOfInterest;
    }

    @Override
    public double calculateInterest() {
        return (principalAmount * durationInYears * rateOfInterest) / 100;
    }
}
```

```
class RecurringDeposit extends Account {
    private int monthlyDeposit;
    private int durationInMonths;
    private double rateOfInterest;

    public RecurringDeposit(String accountHolder, int monthlyDeposit, int
durationInMonths, double rateOfInterest) {
        this.accountHolder = accountHolder;
        this.monthlyDeposit = monthlyDeposit;
        this.durationInMonths = durationInMonths;
        this.rateOfInterest = rateOfInterest;
    }

    @Override
    public double calculateInterest() {
        double maturityAmount = monthlyDeposit * durationInMonths;
        return (maturityAmount * durationInMonths * rateOfInterest) / (12 * 100);
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        int choice = sc.nextInt();

        switch (choice) {
            case 1:
                sc.nextLine();
                String fdName = sc.nextLine();
                double fdPrincipal = sc.nextDouble();
                int fdDuration = sc.nextInt();
                double fdRate = sc.nextDouble();

                FixedDeposit fd = new FixedDeposit(fdName, fdPrincipal, fdDuration,
fdRate);
                System.out.printf("Interest for FD: %.1f", fd.calculateInterest());
                break;

            case 2:
                sc.nextLine();
                String rdName = sc.nextLine();
                int rdDeposit = sc.nextInt();
```

```
            int rdDuration = sc.nextInt();
            double rdRate = sc.nextDouble();

            RecurringDeposit rd = new RecurringDeposit(rdName, rdDeposit,
rdDuration, rdRate);
            System.out.printf("Interest for RD: %.1f", rd.calculateInterest());
            break;

        default:
            System.out.println("Invalid Choice");
      }
   }
}
```
